**DETAILED ACTION**  
**EXAMINER'S AMENDMENT**

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Attorney Chid S. Iyer on May 29, 2008.

The application has been amended as follows:

The abstract has been re-written as follows:

-- A wafer pre-alignment apparatus according to this invention includes a wafer rotating member, a rotation detecting member, a light emitting member for emitting light toward the periphery of the wafer, a CCD linear sensor linearly arranged and signal processing member for detecting the edge position of the wafer to acquire at least one of an orientation flat position, notch position and center position of the wafer on the basis of the edge position detected, and further includes an up-down counter for converting a signal received from the rotation detecting member into rotating position information, a measured angle setting register for storing the rotation position information when the wafer rotating member rotates by an interval angle and a comparator for comparing a set value in the measured angle setting register and a counted value in the up-down counter.—

***Amendment***

The amendment filed on 12 May 2008 has been entered into this application.

***Response to Arguments***

Applicant's arguments, see pages 5-6, filed on 12 May 2008, with respect to claims 1 and 2 have been fully considered and are persuasive. The rejection(s) of claims 1 and 2 under 35 U.S.C 112, first paragraph, and 35 U.S. C. 103 (a) has been withdrawn.

***Allowable Subject Matter***

Claims 1-2 are allowed.

As to claim 1, the prior art of record, taken alone or in combination, fails to disclose or render obvious a signal processing member for repeatedly detecting the edge positions of the wafer at a plurality of optional points over the outer periphery of the wafer when it receives a signal from the CCD linear sensor and a signal from the rotation detecting member and wherein the apparatus sequentially loads outer peripheral data corresponding to one round of the wafer data without stopping the motor, as specify in the specification, in combination with the rest of the limitations of the claim.

As to claim 2, the prior art of record, taken alone or in combination, fails to disclose or render obvious repeatedly detecting the edge position of the wafer at the measurement points over the outer periphery of the wafer and wherein the apparatus sequentially loads outer peripheral data corresponding to one round of the wafer data

Art Unit: 2886

without stopping the motor, as specify in the specification, in combination with the rest of the limitations of the claim.
